

FOR IMMEDIATE RELEASE

DEISTER CONCENTRATOR MOVES TO NEW FACILITY

Fort Wayne, IN, September 12, 2017 – Deister Concentrator, a company that has a 112 year history of engineering and manufacturing equipment for the mineral and mining industries, recently moved into its new home. In preparing to move to its new facility and with an increase in equipment demand, Deister contracted for a 12,000 square foot addition. The new home is in Fort Wayne’s Airport Industrial Park, close to the Fort Wayne International Airport, and with easy access to Interstate 69.

Deister Concentrator was founded by Emil Deister, a German immigrant, in Fort Wayne, Indiana. Emil developed, perfected and patented a seemingly simple concept in mineral separation. While continuing to enhance the engineering of the tables that were Emil’s original design, today Deister also produces a variety of cyclones, sieve bends, feed distributors and classifiers. Emil’s original design of a single deck table, used for mineral separation, today includes a laboratory table along with a double and triple deck table. Deister is the only company in the world that manufactures the triple deck table.

In discussing the move to Deister’s new home Don Ross, Operating Partner, stated that “With this move, we are excited about the opportunity this provides to meet the increasing demands of our customers. We are well positioned for future growth. Deister has a long and rich history in the mineral and mining industries and we look forward to meeting the ever-changing needs of our partners in this industry.”
